AB Provided is a battery with a higher capacity and superior charge-discharge cycle characteristics. A cathode contained in a package can and an anode contained in a package cup are laminated with a separator in between. The separator is impregnated with an electrolyte solution formed by dissolving lithium salt in a solvent. The anode comprises a tin -containing material including metallic tin and an intermetallic compound including tin in the same particle. A higher capacity and superior charge-discharge cycles can be obtained by the tin -containing material.

AB A solid electrolyte cell in which cell characteristics are not deteriorated even on overdischarge to the cell voltage of 0 V, such that the shape of the cell encapsulated in the laminate film is maintained. The cell includes a cathode containing a compound represented by the general formula $\text{Li}_x\text{Fe}_y\text{MPO}_4$ where $0.05 \leq x \leq 1.2$, $0 \leq y \leq 0.8$, and M is at least one selected from the group consisting of Mn, Cr, Co, Cu, Ni, V, Mo, Ti, Zn, Al, Ga, Mg, B and Nb, an anode and a solid electrolyte. An electrode unit 1 comprised of the cathode and the anode layered together with interposition of the solid electrolyte is encapsulated with a laminate film 2.

AB The invention provides novel lithium-mixed metal materials which, upon electrochem. interaction, release lithium ions, and are capable of reversibly cycling lithium ions. The invention provides a rechargeable lithium battery

which comprises an electrode formed from the novel lithium-mixed metal materials. Methods for making the novel lithium-mixed metal materials and methods for using such lithium-mixed metal materials in electrochem. cells are also provided. The lithium-mixed metal materials comprise lithium and at least one other metal besides lithium. Preferred materials are lithium-mixed metal phosphates which contain lithium and two other metals besides lithium.

LA English

AB Cobalt-tin intermetallic compds. of different stoichiometries were studied by
means of the perturbed angular correlation (PAC) technique. The hyperfine
interaction parameters for ^{111}Cd probes in the crystal lattices of CoSn_2 and
 Co_3Sn_2 were determined. A $T^{3/2}$ temperature dependence of the elec. field
gradient (EFG) in CoSn_2 compound was found. Due to the thermal interdiffusion
in a bilayer Co/Sn sample the formation of the stoichiometric CoSn phase was
observed

AB Moessbauer spectroscopy was used to study the effect of Sn ion beam irradiation on the phase composition of a Co-Sn electroplate and structure of Al and Ni substrates. Formation of the γ -Co₃Sn₂ phase occurred on a Co-Sn electroplate after ion-beam irradiation Alloying of Ni by ion implantation with Sn led to formation of substituted Ni₃Sn and Ni₃Sn₂ intermetallic compds.

TI The thermodynamic properties of solid cobalt-tin alloys

AU Coemert, H.; Pratt, J. N.

CS Dep. Metall. Mater., Univ. Birmingham, Birmingham, B15 2TT, UK

SO Thermochimica Acta (1985), 84, 273-86

CODEN: THACAS; ISSN: 0040-6031

DT Journal

LA English

AB Reversible potentials of galvanic cells of the form Pt|(Co- Sn)(alloy) + SnO₂|ZrO₂ + CaO|O₂(air)/Pt were measured at 873-1323 K. The results were used to derive the thermodyn. activities and the partial and integral free energies, enthalpies, and entropies of formation of the γ , γ' , CoSn [12297-65-3], and CoSn₂ [12394-61-5] intermediate phases. Exothermic heats of formation and neg. entropies of formation were observed throughout the system. The enthalpies of formation were compared with independent calorimetric and theor. values, and underlying factors influencing their values were considered. The possible contributions to the entropies of formation of the solid phases are discussed and their Debye temps. are estimated; θ_D values of approx. 273, 256, and 169 K are suggested for Co₃Sn₂ [12526-67-9] (γ), CoSn, and CoSn₂, resp.

AB The cast Sn-Co alloys γ' -Co₃Sn₂

(hexagonal) and CoSn₂ (tetragonal) were prepared and studied by using Moessbauer and x-ray measurements. These results were used in the

identification of the components of **electrodeposited Sn -Co** alloys obtained from mildly alkaline sulfate baths. The γ' -Co₃Sn₂ (hexagonal), CoSn (cubic) and metallic Sn were detected as components of the **electrodeposited** alloys. The relative amts. of the components is highly dependent on the bath operation conditions, and no γ' -Co₃Sn₂ was observed when the concentration of electroactive Sn in the plating bath was high. The Moessbauer parameters of all the studied alloys are given and are well within the observed values for binary Sn alloys.

AB The binding energy of Co 2p_{3/2} in the compds. is 777.5, 777.5, and 777.4 eV, resp., as compared to that of pure Co 778.28 eV. This reveals a transfer of electronic d. from Sn to Co atoms, resulting in a donor-acceptor Sn-Co bond. One can consider the Sn layer as a 2-dimensional long ligand of Co. The binding energies of Sn reflect the retention of the initial valent-electron structure of Sn in the layers.

AB The Co analog of electrodeposited NiSn was plated from an acid fluoride bath. Sn deposition had to be hindered more than necessary in Sn-Ni baths. The Co alloy was finegrained, hard, and bright, with the composition CoSn. X-ray diffraction showed it crystallized with a cubic structure ($a = 4.20 \text{ \AA}$) differing from hexagonal cast CoSn. Electrodeposited CoSn decomposed at 200° without changing appearance, into CoSn₂ and γ' -Co₃Sn₂, and tarnished at 350°. It was completely passive in aqueous media from pH 1.4 to 14, and the passivation potential is estimated to be (298°K) $-(0.44 - 0.06 \text{ pH}) \text{ V}$. The passive film can transform to higher oxidation states, the highest with a potential $+(1.68 - 0.06 \text{ pH}) \text{ V}$, but it remains protective. CoSn dissolved fairly readily in concentrated HCl.

AB **Co₃Sn₂**, **CoSn**, and **CoSn₂** were observed in the **Co-Sn** system during thermal and x-ray diffraction anal. and microstructural and microhardness studies of alloys prepared in a high-frequency furnace in a He atmospheric No **Co₂Sn** compound was observed The polyhedral structure of the alloy with 40% **Sn** corresponded to **Co₃Sn₂**. Alloys with 24% **Sn** had a eutectic structure formed by a solid solution of **Co** and **Co₃Sn₂**. The alloys with 25-39% **Sn** were hypereutectic and consisted of a solid solution of **Co₃Sn₂** and eutectic. The polyhedral structure was detected in alloy containing 49% **Sn** and consisting of **CoSn**. The alloys with 41-48% **Sn** had 2-phase structures of a solid solution of **Co₃Sn₂** and **CoSn**. A 2-phase structure, formed by a solid solution from **CoSn** and **CoSn₂**, was evident from pictures of alloys containing 54-59% **Sn**.

NOVELTY - The cathode material contains tin and at least one element chosen from iron, nickel and/or cobalt, and comprises a phase of specific compound(s). The cathode material is manufactured by rapid solidification method. The phase of intermetallic compound does not exist in the cathode material.

DETAILED DESCRIPTION - The cathode material contains tin and at least one element chosen from iron, nickel and/or cobalt, and comprises a phase of specific compound(s). The cathode material is manufactured by rapid solidification method. The cathode material does not contain the phase of an intermetallic compound of formula: AaSnb, where A is element chosen from nickel, cobalt and iron, and a/b is atomic ratio and is greater than 1. An INDEPENDENT CLAIM is included for manufacture of cathode material.

USE - For non-aqueous secondary battery such as lithium ion secondary cell used for portable electronic device.

ADVANTAGE - The cathode material has high discharge capacitance and improved initial-stage efficiency, with reduced irreversible capacitance during first-time charging and discharging. DESCRIPTION OF DRAWINGS - The graph shows the X-ray diffraction result of the cathode material. (Drawing includes non-English language text)

TECH

INORGANIC CHEMISTRY - Preferred Composition: The cathode material further contains element(s) chosen from aluminum, titanium, zirconium and indium, and does not contain Co₃Sn₂ phase. The cathode material comprises CoSn phase and/or CoSn₂ phase.
